Amendments to the Claims

This listing of claims will replace all prior listings of claims in the application.

Listing of Claims

- 1. (Currently Amended) A thermally sensitive recording medium comprising an undercoating layer containing a pigment and a binder as main components and a thermally sensitive color developing layer containing colorless or pale colored basic leuco dye and a color developing agent which develops color by reacting with said basic leuco dye as main components on a substrate, wherein said undercoating layer contains sodium alginate as a water-retention agent and a pigment whose oil absorbing capacity prescribed by JIS K 5105 is from 80cc/100g to 120cc/100g as a pigment, further solid concentration of a coating for the undercoating layer is from 25% to 45% and dynamic water-retention capacity, which is Water retention measured with AA-GWR, is $350g/m^2$ or less.
- 2. (Currently Amended) The thermally sensitive recording medium of claim 1, wherein the content of the water-retention agentsodium alginate is 0.01 to 1 weight part to 100 parts of pigment.
 - 3. (Canceled)
- 4. (Currently Amended) The thermally sensitive recording medium of claim 1, wherein B viscosity of 1% aqueous solution of the sodium alginate is 100mPa·s or more.
- 5. (Previously Presented) The thermally sensitive recording medium according to claim 1, wherein the pigment whose oil absorbing capacity prescribed by JIS K 5105 is from 80cc/100g to 120cc/100g is the calcined clay.

- 6. (Currently Amended) The thermally sensitive recording medium according to claim 1, wherein B viscosity at 25°C of a coating for undercoating layer is $200-1500\text{mPa}\cdot\text{s}$ and viscosity at the shear rate of $4.0\times10^{-5}\text{sec}^{-1}$ to $8.0\times10^{-5}\text{sec}^{-1}$ at 25°C of a coating for undercoating layer is $20-100\text{mPa}\cdot\text{s}$.
- 7. (Currently Amended) The thermally sensitive recording medium according to claim 1, wherein the thermally sensitive recording layer is formed by a curtain evaluating method.
- 8. (Currently Amended) A method for preparation of a thermally sensitive recording medium comprising, forming an undercoating layer containing a pigment and a binder as main components and a thermally sensitive color developing layer containing colorless or pale colored basic leuco dye and a color developing agent which develops color by reacting with said basic leuco dye as main components on a substrate, wherein said undercoating layer contains sodium alginate as a water-retention agent and a pigment whose oil absorbing capacity prescribed by JIS K 5105 is from 80cc/100g to 120cc/100g as a pigment, further solid concentration of a coating for the undercoating layer is from 25% to 45% and dynamic water-retention capacity, which is Water retention measured with AA-GWR, is 350g/m² or less.
- 9. (New) The thermally sensitive recording medium according to Claim 1, wherein solid concentration of the coating for the undercoating layer is from 25% to 45% and dynamic water-retention capacity, which is Water retention measured with AA-GWR, is $350g/m^2$ or less.
